BioCleaner

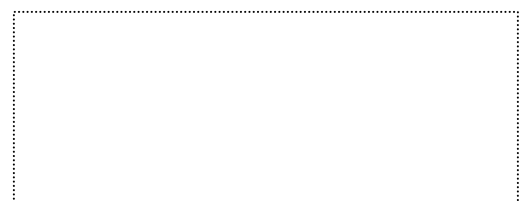

Biological Treatment of high strength wastewater is nothing new. However, most of these systems are large, expensive, and often complicated. They do not have to be. BioCleaner has created a very simple and relatively inexpensive solution for high BOD wastewater as well as for leachate and other difficult wastewater. The system also works well on standard domestic wastewater. Unlike traditional treatment technologies, we generate little or no sludge, and limited odor combined with very low operating costs and limited maintenance requirements.

The BioCleaner system is a revolutionary, patented US technology that harnesses the power of nature to treat all types of wastewater. The system uses specifically developed microbes that are present in a patented media and are produced on a constant basis . These microbes are combined this with a highly efficient but simple aeration technology to mix these microbes together with the oxygen throughout the tank. The innovative technology has received ETV Verification through its work in the Phillipines and has treated wastewater in many locations around the world but it is born and made in the United States. It is effective in tanks, lagoons, ponds, etc.

Effective On:

- BOD/COD
- Oil & Grease
- Nitrates/Ammonia
- Phosphates
- Metals
- Odor
